

Ferrari Dental Care

Bonding can be used to repair tooth chips, fill small gaps between teeth, cover sensitive areas from gum recession or to build up worn down teeth. It is a tooth-coloured material that can be closely matched to your other teeth.

The technique of bonding utilizes a soft material called composite resin with liquid called bond. This acts like a glue to build up the tooth to its original size. When placing the composite it is manipulated to create a similar shape to the original tooth.

The composite and bond is set hard using an intense light. This type of filling (unlike the silver fillings) is set hard immediately.

Once the area has been built up, it is then trimmed into the correct shape and polished to look like a natural tooth.

Bonding is an instant result as it is completed in the dental chair and does not rely on a dental technician.

Ferrari Dental Care

Bonding works best on low stress areas of the mouth. It is not necessarily a cure for all dental problems, but in most cases it can improve your smile in a single appointment, and with minimal expense.

For more information on bonding or solutions for your smile speak with one of the dentists or team members.
