

Ferrari Dental Care

For years people have had implants to replace various parts of the body, such as the hip joint. Today we are able to replace missing teeth in the same way.

Already thousands of people have had implants to replace missing teeth.

The implant is simply an artificial design to replace the root section of the tooth.

An x-ray of a fitted implant

Implants can replace one or many teeth. They can also be used to stabilize dentures to avoid discomfort from movement.

Implants are made from titanium. An oral surgeon places the implant into the jaw and is positioned like other teeth.

It is left for a period of time, after which a crown is attached at the practice.

Ferrari Dental Care

The crown is colour matched to your surrounding teeth. It is fitted over the top of the implant giving the appearance and colour of a natural tooth.

Implants can last a long time with proper dental hygiene maintenance and are the next best thing to having a natural tooth.

Before you can have an implant the health of the gums and bone structure is assessed. An oral surgeon works with the dentist in completing the implant and assessment.

To find out if an implant is right for you, talk to us next time you are in and we will discuss the options with you.

**We are open
late two evenings on
Mondays and Tuesday.**

Fast claims... on the spot

Now you can claim through us. This means that your claims are processed on the spot and you only have to pay the difference or "gap".
